

Blue Star Gold Commences High Resolution Geophysical Survey in Preparation for Drill Testing Priority Targets on its Ulu and Hood River Projects

Vancouver, British Columbia--(Newsfile Corp. - June 23, 2021) - **Blue Star Gold Corp. (TSXV: BAU) (FSE: 5WP) ("Blue Star" or the "Company")** announces that Precision GeoSurveys Inc. ("Precision") of Langley, BC has commenced the first stage of the Company's 2021 exploration program over high potential target areas within the Ulu and Hood River Projects. The 1,800-line kilometre high resolution heli-borne geophysical survey will utilize Precision's proprietary four-sensor magnetic gradient system to refine the structure, alteration, and lithology in targets preliminarily defined by geological interpretation, surface mapping and sampling and prioritized by proximity to the known Flood Zone deposit.

Approximately 400-line kilometres will also be conducted at the Roma project. This survey, which covers an area where folded stratigraphy is juxtaposed against the Kennarctic shear zone and hosts historic +5 g/t Au samples in veining associated with the folding, is expected to be elevated to drill readiness for 2022.

The Ulu and Hood River survey will assist in refining the geological interpretation and the target definitions prior to the execution of the drilling program slated to commence in the coming days. Targets for the upcoming 2021 program are prioritized based on impact to existing resources and potential scale of new discoveries (closer to Flood Zone deposit is better):

- Multiple 1st priority targets occur within ~1 km of the Flood Zone including Axis, Central Corridor and East Limb,
- Numerous 2nd priority targets exist along the 5 km long Ulu Fold which extends from the Flood Zone deposit onto the contiguous Hood River project up to the North Fold Nose,
- Several prospective areas on the east side of the Hood River project and the Roma project will undergo further target refinement in preparation for drill testing in the future,
- This will be the first program developed and operated by Blue Star's current team that has been involved with important gold discoveries in Nunavut.

Blue Star Properties

The Company's wholly owned Ulu and Hood River properties are located approximately 525 km NNE of Yellowknife, NT in the Kitikmeot region of western Nunavut. Kugluktuk is approximately 210 km to the NW.

The Ulu lease and the contiguous Hood River property together encompass greater than 9,000 hectares of highly prospective exploration ground. The recent acquisition of the underexplored Roma property that lies approximately 30 km north increased the Company's landholdings by 7,683 hectares, making Blue Star the largest title holder in the highly prospective and underexplored High Lake Greenstone Belt.

The Ulu lease hosts the advanced stage Flood Zone gold deposit, where a significant high-grade gold resource has been outlined by previous workers. Several additional gold zones (including but not limited to Zebra, Contact, Central, Axis, and Gnu prospects) are spatially related to the axis of the 5 km long Ulu Fold which extends from the Ulu lease onto the northern part of the Hood River property and culminates at the North Fold Nose Zone. The eastern side of the Hood River property is contiguous to the Ulu lease and hosts over twenty known gold showings. The promise of the Hood River prospects are anchored in the similar stratigraphic sequence and same deformation history (including tight folding) as the Flood Zone. One of the most prospective target areas on the eastern Hood River property is the 4 km long Crown-Pro trend which has seen only limited, shallow drilling.

The geologic setting and style of gold mineralization at the Roma project is similar to that found at the Ulu and Hood River projects. Based on historical data compilation, multiple significant gold showings are present on the property within a 6.5 km by 2.4 km area, including several drill ready targets. No follow up drilling is known to have been completed on this property after BHP's initial drill program in the 1990's which returned a best interval of 12.38 g/t Au over 2.31 m from a limited program (Roma Main). Approximately 4 km southwest of Roma Main is the Roma Fold which is defined by numerous high-grade gold showings within a 1.6 km x 0.55 km area on the east limb of an anticlinal fold structure adjacent to the Kennarctic Shear Zone; all these target areas in the anticline remain undrilled.

Qualified Person

Darren Lindsay, P. Geo. and Vice President Exploration for Blue Star, is a Qualified Person under National Instrument 43-101 ("NI 43-101") and has reviewed and approved the technical information contained in this news release.

About Precision GeoSurveys Inc.

Based in Langley, B.C., Precision has the expertise and personnel to plan and execute a successful geo-exploration program. Precision has flown over 500 surveys around the world since 2007 using innovative geophysical technologies.

About Blue Star Gold Corp.

Blue Star is a gold and silver company focused on exploration and development within Nunavut, Canada. The Company owns the **Ulu Gold Property** lease, an advanced gold and silver project, and the highly prospective **Hood River Property** that is contiguous to the Ulu mining lease. With the recent acquisition of the **Roma Project**, Blue Star now controls over 16,000 hectares of highly prospective and underexplored mineral properties in the High Lake Greenstone Belt, Nunavut. A significant high-grade gold resource exists at the Flood Zone deposit (Ulu lease), and numerous high-grade gold occurrences and priority targets occur throughout the Ulu, Hood River and Roma Projects.

Blue Star is listed on the TSX Venture Exchange under the symbol: BAU and on the Frankfurt Exchange under the symbol: 5WP. For information on the Company and its projects, please visit our website: www.bluestargold.ca.
